

# Banyon Data Partners with Maple Island Group for Cloud Remote Installations

The Cisco VPN (Virtual Private Network) Firewall provides network security and remote access functions to your network.

It allows remote users to securely connect to any device on the inside of their network (office). This includes PC's, printers, and servers. You may securely remotely access data on your server or remotely control your office PC through an encrypted secure connection. You may remotely control your office desk PC and have full functionality as if you were sitting at our desk in the office.

An additional bonus is that you will not need any additional software with a recurring monthly expense for each pc or device on your network. This makes this method a very cost-effective way to work remotely for one or all of your users simultaneously.

Please keep in mind that this Cisco Firewall is also a key component for your systems security. This will help keep your data secure and reduce your risk of a hacker gaining access to your system and encrypting your data and holding your entity for ransom. (Ransomware).
